

Final 2 Questions:

1. I learned that working with a partner was hard at certain times. For example: my partner's English isn't as good as mine, so he spelled 4th as "Forth" and I spelled it as "Fourth". I then had to go through my entire program to change my spelling to "Forth" so that our modules would work together. I also found that the way we named functions had some inconsistencies that caused us to run into some hiccups with the development.

My partner thought that I was sometimes distracting, because I would often engage him in off-topic conversations mostly about video games. I would have to agree with him on that, although it didn't happen every day.

I also found that having to leave my house and walk to our meeting place (MC building) every day and stay there until 10pm was very tough, especially in the colder days of these past two weeks. When I worked alone, I never had to leave the comfort of my house.

Finally, I found that working with a partner can be frustrating when small mistakes are made, but overall it was more fun than working alone. While coding alone can be a chore in some assignments (like the reverse polish notation calculator assignment) I found that this assignment was more enjoyable, and having a partner definitely contributed to the fun.

2. If I could go back, I'd have started working on the program earlier. I would have also started with getting my board to display first, and build up from there. The way we worked on our program was the exact opposite to that. We both started from the functions and worked our way to the simpler things, such as getting the board to display. I also would have asked my professor more questions about how he would tackle certain problems.
